Dear Participants,

here is a little overview of which documents you should read, and what you need to set up until the Workshop!

A lot of the things we shared with you are optional and are meant for those of you who want to go deeper – so here are steps you need to take:

Step 1: Get Python

If you have not worked with Python previously, the first thing you need to do, is to get Python, as well as an IDE (Integrated Development Environment – the place where you do your coding) running on your device!

For this, refer to the “Guide How to Install VS Code and ANACONDA for Python.pdf” in the “Learn Python” Folder.

If you already have a working Python setup on your device, you can skip this step.

Step 2: Python Basics

If you are not familiar with the basics in Python – Check out the “An Introduction to Python” document!

We recommend going through at least the “Learn the Basics” Section on learnpython.org, to be familiar with the fundamental concepts.

We have linked multiple further resources which you can use beyond that as well.

Furthermore, we got the permission to share multiple resources from the University of Osnabrück for learning Python – you can find them on the Drive. Please do NOT share those.

Step 3: Python & Virtual Environments

We highly recommend doing some beginner exercises, as theoretical knowledge on how Python works will only get you so far.

Learn how to set up a virtual environment. This is not necessarily a beginner level skill, however knowing how to do it is highly useful, and something you will encounter in many research contexts.

Refer to the "**Guide How to set up a virtual environment for Python.pdf**" in the Learn Python Folder, for a short guide how to set up a virtual environment. Note that there are other ways to do this as well, our guide is just providing one easy way to do it.

> *Caution*: The guide assumes that you have either miniconda or anaconda installed and are using VS Code as your IDE – if that is not the case, some details may differ.
>
> You do not need to install any packages within your virtual environment yet, this is something we will do as part of the Hackathon

As you may notice, there are some documents/links that we have shared, that we did not touch upon in detail in this Roadmap – those are all additional things that you can look through if you are interested/have the time, but are not necessary to be able to participate in the Hackathon.

If you encounter any issues whilst setting up Python / the IDE / virtual environment, and can't find a solution, please do not hesitate to use the WhatsApp Group to ask questions, so that either other participants, or one of the organizers can help you out.

The same of course applies to any other question you might have regarding the Hackathon, or any of the content on GitHub / Drive.
